Docket No. AUS000101US1

ABSTRACT OF THE DISCLOSURE

METHOD AND APPARATUS FOR IDENTIFYING UNIVERSAL
5 ## RESOURCE LOCATOR REWRITING IN A DISTRIBUTED
DATA PROCESSING SYSTEM

A method and apparatus in a data processing system
for detecting monitoring of access to content. Content
10 from a source using an identifier is requested, and a set
of identifiers used to reach the content is sent to a
validation service. The validation service retrieves
content using the set of identifiers. Identifiers within
the retrieved content is compared with identifiers
15 located within the set of identifiers. If a match
between identifiers in the set of identifiers and those
identifiers in the retrieved content is absent, a
response is generated indicating that access to the
content is being monitored. In response to receiving the
20 response from the validation service, the receipt of
content from the source is selectively prevented.
